

On Sustainable Investing

Now seems like a good time to share our view on where markets and investors are on the topic of Sustainable Investing today. To start, investor confusion around the terminology and why we should care seems to be ebbing. Yes, sustainability is still defined and perceived in myriad ways, but what it boils down to largely is the efficient use of resources. Any system—a company, an industry, a market, an ecosystem—requires resources to survive. To the extent those resources are harmed or depleted, the survival of that system is at risk. To the extent those resources are maintained or renewed over time, that system has what it needs to sustain itself at least and potentially even thrive. The sustainability movement is a call for change in how we manage our resources, in particular our environmental, human and social resources. Thoughtless exploitation of those resources can work for some period of time and for some portion of the population, but in the end that approach is unsustainable.

Sustainable investing is an extension of this concept. The basic idea is to invest in businesses that employ best practices around the use of all forms of capital: financial, environmental, human, and social. Those businesses possess the best chance not just to survive, but to thrive. And of course sustainable investing also means avoiding businesses with high costs and headline risks due to poor governance and exploitative behaviors. Such behaviors are less and less tolerated by consumers, governments, and regulators. Increasingly, these behaviors make them less attractive to investors, too.
